The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a p(95-114) EGFP (enhanced green fluorescent protein) (MI-M40) DBN (dengue)-2 (136F) plasmid DNA encoded protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vaccine for preventing or treating pathological conditions from nonspecific febrile illnesses to severe hemorrhagic manifestations or

The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Plavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M1-40/DEN (dengue)-2 (P36) mutant protein.

                                                                                                                               peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M20-40/DEN (dengue)-2 mutant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses pathological conditions, encephalitic syndromes and these pathological conditions are linked to Plavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M10-40/DEN (dengue)-2 mutant protein.

                                                                                                                                                                                                                                                                                  New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vaccine for preventing or treating pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations or
                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Plavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M32-40/DEN (dengue)-2 mutant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gene therapy, protein purification; virucide; cytostatic; vaccine; hemorrhage; bleeding; infection; flavivirus infection; neoplasm; cancer; DEN; dengue; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Plavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M1-40/DEN (dengue)-2 protein.

The invention particularly relates to DEN-1 M (a membrane protein anchored in envelope surrounding the nucleocapsid of the virus) ectodomain sequence, Den-1-C amino acid sequence and DEN-2 M ectodomain sequence. Sequences of the invention are useful for inducing apoptosis in a cell of a patient suffering from cancer or flavivirus infection. They are also useful for screening molecules which inhibit apoptosis. The present sequence is DEN-2 virus M ectodomain. (Updated on 29-AUG-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                          New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vaccine for preventing or treating pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations or
                                                                                                                                                                                         The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Plavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M1-40/YF (yellow fever).17D (T34, I36, I37, H39) mutant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel apoptosis inducing polypeptide fragments of Dengue virus-1 or 2 M protein, useful for inducing apoptosis in a cell of a human patient
                                                                                                                                                                                                                                                                                                                                                                     Gaps

THE STATE OF THE S

```
The invention relates to pro-apoptotic fragments of the Dengue virus (DEN) pRW and E glycoproteins, methods for screening molecules capable of inducing apoptosis and methods of inducing apoptosis in a cell. The invention particularly relates to DEN-1 M (a membrane protein anchored in envelope surrounding the nucleocapsid of the virus) ectodomain sequence, ben-1-C amino acid sequence and DEN-2 M ectodomain sequence. Sequences of the invention are useful for inducing apoptosis in a cell of a patient suffering from cancer or flavivirus infection. They are also useful for suffering molecules which inhibit apoptosis. The present sequence is (95-114) EGFP DEN-2 fusion protein construct. This construct comprises 95-114 of the C-terminus of the C-protein of the DEN-1 virus strain BR/90 fused to the N-terminus of enhanced green fluorescent protein (EGPP) and DEN-2 virus strain Jamaica M ectodomain (DEN-2 polyprotein) fused to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to platviriness (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               virucide; Flavivirus; arboviruses group B; gene therapy; truncated prM;

The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of a Dengue virus type 2 (DBN-2) C15/truncated prM antigen flusion protein of the invention which comprises the C-terminal 15 amino acids of the capsid protein fused to a truncated form of the prM protein lacking the C-terminal 15 amino acids.
                                                                                                          ö
sequence is that of a Dengue virus C15/truncated prM antigen fusion protein of the invention which comprises the C-terminal 15 amino acids of the capsid protein fused to a truncated form of the prM protein lacking the C-terminal 15 amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.

```
ö
The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Flaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus servoypes in a sample and for gene therapy. The current sequence is that of a Dengue virus C15/truncated prM antigen fusion protein of the invention which comprises the C-terminal 15 amino acids of the cruminal 15 amino acids of the C-terminal 15 amino acids of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This protein represents a fusion protein comprising an M protein epitope from Dengue virus type 2 inserted into the P64K protein from Neisseria meningitidis. Synthetic peptides based on the Dengue virus epitope sequences (AAM75404-W75408) and fusion proteins can be used to raise antibodies. The peptides, protein and antibodies are all useful for diagnosis and treatment of Plavivirus infection, e.g. in vaccines. (Updated on 25-WAR-2003 to correct PI field.) (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptide(s) and fusion proteins useful for diagnosis and treatment of flavivirus infection - contain cross-reactive epitopes from Dengue virus pre-M/M protein and can induce neutralising antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Flaviviruses, as well as in detecting and/or diagnosing the presence of antibodies against the bengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus C15/prM/E partially human codonoptimised antigen fusion protein of the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length partially codon-optimised prM protein and envelope (B) protein.
                                                                                                                                                                                                                          New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.

The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the bengue virus serotypes in a sample and for gene therapy. The current sequence is that of the bengue virus CIS/prM/E antigen fusion protein of the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length prM protein and envelope (E) protein.
         The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboiruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue Virus C15/prM/E antigen fusion protein of the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length prM protein and envelope (E) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                virucide; Flavivirus; arboviruses group B; gene therapy; C15/prM/E; prM; envelope; capsid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to plaviviruess (arboviruess group B), including Dempure viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus c15/prw/B partially human codonoptimised antigen fusion protein of the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length partially codonoptimised prM protein and envelope (E) protein.

The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 904 sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serctypes in a sample and for gene therapy. The current sequence is that of the Dengue virus CIS/prM/E antigen fusion protein of the invention which comprises 15 amino acids of the capsid (c) protein fused to the full-length prM protein and envelope (E) protein.
                                                                                                                                                                                                                                                                                                             New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                virucide; Flavivirus; arboviruses group B; gene therapy; DEN-2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This protein represents a fusion protein comprising an M protein epitope from Dengue virus type 4 inserted into the P64K protein from Neisseria meningitidis. Synthetic peptides based on the Dengue virus epitope sequences (AAM75404-W75408) and fusion proteins can be used to raise antibodies. The peptides, protein and antibodies are all useful for diagnosis and treatment of Flavivirus infection, e.g. in vaccines. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide(s) and fusion proteins useful for diagnosis and treatment of flavivirus infection - contain cross-reactive epitopes from Dengue virus pre-M/M protein and can induce neutralising antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        virucide; Flavivirus; arboviruses group B; gene therapy; C15/prM/E; prM; envelope; capsid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the
                                                                                                          The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Flaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current antigen fusion protein of the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length prM protein and envelope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    aB
        New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         virucide; Flavivirus; arboviruses group B; gene therapy; C15/prM/E; prM;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Flaviviruses (arboviruses group B), including Dengue viruses, as well a in detecting and/or diagnosing the presence of antibodies against the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acid useful as vaccine for preventing flavivirus infection, comprises transcriptional unit encoding signal sequence of one flavivirus and immunogenic flavivirus antigen of a second flavivirus.
Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus C15/prM/E antigen fusion protein of the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length prM protein and envelope (E) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            transcriptional unit encoding a signal sequence of a structural protein of a first flavivirus and an immunogenic flavivirus antigen of a second flavivirus, where the transcriptional unit directs the synthesis of the antigen. The polynucleotide of the invention has virucide activity, and acts as a vaccine. A composition of the invention is useful for immunising a subject against infection by a flavivirus. The polynucleotide is useful as a vaccine for preventing flavivirus infection. The sequence represents plasmad pcBD2-14-6, which contains dengue-2 virus (DEN-2) prM and E proteins
                                                                                                                                                                                                                                                                                                                                                                                                 Flavivirus; immunogenic flavivirus antigen; virucide; vaccine; prM-E; pCBD2-14-6; dengue virus; DEN-2.

```

```
Novel isolated nucleic acid useful as vaccine for preventing flavivirus infection, comprises transcriptional unit encoding signal sequence of one flavivirus and immunogenic flavivirus antigen of a second flavivirus.
                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel nucleic acid comprising a transcriptional unit encoding a signal sequence of a structural protein of a first flavivirus and an immunogenic flavivirus antigen of a second flavivirus, where the transcriptional unit directs the synthesis of the antigen. The polymucleotide of the invention has virucide activity, and acts as a vaccine. A composition of the invention is useful for immunising a subject against infection by a flavivirus. The polymucleotide is useful as a vaccine for preventing flavivirus infection. The sequence represents plasmid pCB9D2-IJ-4-3, which contains dengue-2 virus (DEN-2) prM, M and E, and Japanese encephalitis virus E
  Flavivirus, immunogenic flavivirus antigen, virucide, vaccine, prM-E, pCB9D2-1J-4-3, Japanese encephalitis virus, dengue-2 virus, DEN-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DEN-2; flavivirus; envelope protein; immunisation; vaccine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated nucleic acid useful as vaccine for preventing flavivirus infection, comprises transcriptional unit encoding signal sequence of one flavivirus and immunogenic flavivirus antigen of a second flavivirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel nucleic acid comprising a transcriptional unit encoding a signal sequence of a structural protein of a fits flavivirus and an immunogenic flavivirus antigen of a second flavivirus, where the transcriptional unit directs the synthesis of the antigen. The polynucleotide of the invention has virucide activity, and immunising a subject against infection by a flavivirus. The polynucleotide is useful as a vaccine for preventing flavivirus infection. The sequence represents plasmid pCBBD2-2J-2-9-1, which contains dengue-2 virus (DEN-2) prM, M and E, and Japanese encephalitis
                                                                                                                                                                               Flavivirus; immunogenic flavivirus antigen; virucide; vaccine; prM-E; pCB8D2-2J-2-9-1; Japanese encephalitis virus; dengue-2 virus; DEN-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

proteins of serotype 2 dengue virus toppiu, pin, enveryor 10, aum Noil proteins of serotype 2 dengue virus infection comprises a dimeric 80% E protein protecting against flavivirus infection comprises a dimeric 80% E protein that has been secreted as a recombinant protein from a eukaryotic cell.

80% E indicates a C-terminally truncated flavivirus E protein. The cdimeric truncated E is formed: (1) by directly linking 2 tandem copies of dimeric truncated E is formed: (2) via the formation of a leucine zipper comain through the homodimeric association of 2 leucine zipper helices each fused to the C-terminus of an 80% E molecule; or (3) via the compined of a non-covalently associated four-helix bundle domain formed to upon association of two helix-turn-helix moieties attached to the C-terminus of an 80% E molecule. Dimeric truncated DEN-2 E proteins are efficiently secreted by recombinant cells, are easier to purify than intracellular proteins, and generate a high titer neutralising antibody cresponds. The method is generally applicable to flaviviruses, in cappaness such as DEN-2, where 80% E comprises amino configuration. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant dimeric flaviviral envelope vaccine - comprising a dimeric 80% protein, useful for protecting against flavivirus, especially dengue virus infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is composed of the capsid, prM, envelope (E) and NS1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Dengue virus; DEN-2; Envelope protein; 80% E; membrane protein; capsid protein; NS1 protein; Dengue haemorrhagic fever; DHF; Dengue shock syndrome; DSS; flavivirus; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                89.1%; Score 49; DB 2; Length 1127;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A polypeptide (AAW09409) comprises the capsid, pre-membrane, envelope and NS1 proteins of dengue virus serotype 2 (DEN-2) variant PR159/S1. A conservative mutation in the envelope protein may be involved in the attenuation of this small-plaque, tempor sensitive variant. Portions of the envelope protein, esp. domain B, can be expressed in eukaryotic hosts (see also AAW09410 and AAW09427-28) transfected with vectors incorporating DEN-231 cDNA (see also AAT47666). These polypeptides can be used in novel subunit vaccines against viral infection, to raise antibodies useful for passive immunisation, and for diagnosis of infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                        The invention relates to a vaccine for protection against Flavivirus infection comprising a dimeric 80% envelope (E), which has been secreted as a recombinantly produced protein from Drosophila Schneider cells and which represents the N-terminal 80% portion of the protein from residue 1-395. Also included are a method for protecting a subject against a flavivirus, an immunogenic polypeptide comprising a dimeric 80% E, an immunogenic composition for protection against Flavivirus infection comprising the immunogenic polypeptide and a carrier, an immunodiagnostic comprising the immunogenic polypeptide and a carrier, an immunodiagnostic for detecting Plavivirus comprising the immunogenic polypeptide and an immunodiagnostic kit for detecting rimmunogenic polypeptide and an immunodiagnostic kit for detecting relavivirus in a test subject. The dimeric 80% E products are envelope proteins of serotypes comprising DEN-1, DEN-2, DEN-3 or DEN-4. The Flavivirus is a dengue virus. The 80% E protein is produced as a dimer by incorporating a helix-turn-helix peptide, to encourage dimerisation. The vaccine is useful for protection against dengue virus infection (e.g. Dengue haemorrhagic fever, DHF, and Dengue shock syndrome, DSS). The present sequence is encoded by the partial genomic sequence of the DEN-2 are an expressents the capatid, membrane, envelope and

neutralising antibody response to a Flavivirus in a murine host. The response comprises a therapeutic amount of a dimeric 80%E, the dimeric 80%E that dimeric 80%E that dimeric 80%E that schools a recombinantly produced protein from Prosophila Schneider cells, and where 80%E represents the N-terminal 80% portion of the protein from residues 1-395. Also described are: an immunogenic polypeptide comprising the dimeric 80%E cited above; an immunogenic composition that generates a protective, neutralising antibody response to a Flavivirus in a murine host, comprising the above immunogenic polypeptide and a physiological carrier; a multivalent immunogenic for the detection of Flavivirus, comprising at least 2 of the above immunogenic of properties of a least 2 flavivirus in a test subject, comprising the above immunogenic or multivalent immunodiagnostic kit for the detection of Flavivirus in a test subject, comprising the above immunogenic or multivalent immunodiagnostic composition is useful for preventing or diagnosting infections caused by dengue virus.                                                                                                                                                                                         The present invention relates to novel mutated flaviviruses comprising a phenotype in which the viral genome is modified by introduction of a mutation, singly or in combination, taken from mutations from recombinant virus bearing Vero adaptation mutations, putative Vero cell adaptation mutations of dengue type 4 virus (DEN4) or mutations known to attenuate dengue type 4 virus. The methods and compositions of the invention are useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection. The present sequence is Dengue virus type 4 strain rDEN2/4delta30 protein
                                                                                                                                 growth

Detection and identification of Flaviviridae in biological sample - by amplifying consensus sequence then hybridisation opt. followed by typing. e.g. sequencing amplified prod.
                                                                                                                                                                                                         The dengue 2 virus is an example of a member of the Flaviviridae which can be identified using the probe pair of the invention. A species-specific sequence can be amplified using the claimed obligonucleotides as primers in a PCR reaction (see AAQ12788 and AAQ12789). Other viruses which can be identified include Japanese encephalitis virus and yellow fever virus. All the dengue 2 virus proteins are encoded from an
                                                                                                                                                                                                                                                                                                                                                       fever virus. All the dengue 2 virus proteins are encoded from an uninterrupted genomic sequence. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 3391;

N;Contains: capsid protein; envelope protein; membrane protein; nonstructural protein NS1
N;Contains: capsid protein NS4b; nonstructural protein NS5
C;Species: dengue virus type 2
C;Species: dengue virus type 2
C;Date: 30-Jun-1989 #text_change 31-Dec-2004

N.Contains: capsid protein C; envelope protein B; membrane-associated protein M; nonstructural protein NS4a; nonstructural protein NS4b; nonstructural protein NS5
C;Species: dengue virus type 2
C;Date: 31-Dec-1992 #sequence revision 31-Dec-1992 #text_change 31-Dec-2004
C;Accession: A42451; A43496; A43763
C;Accession: A42451; A43496; A43763

genome polyprotein - dengue virus type 1 (strain AHF 82-80) (fragment)
Noontains: cappid protein C; envelope protein B; membrane-associated protein M; nonstru
C;Species: dengue virus type 1
C;Date: 30-Sep-1993 #sequence_revision 30-Sep-1993 #text_change 31-Dec-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              C;Superfamily: hepatitis C virus genome polyprotein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             genome polyprotein - dengue virus type 1 (strain CV1636/77) (fragment)
Kontains: capsid protein C; envelope protein B; membrane-associated protein M; nonstru.
C;Species: dengue virus type 1
C;Pate: 30-Sep-1993 #sequence_revision 30-Sep-1993 #text_change 31-Dec-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Access-references: UNIPROT: P27913; UNIPARC: UD100017854D; GB:D00501

A; Hitle: Nucleotide and encoded amino acid sequences of the nonstructural protein NS1 generals and encoded amino acid sequences of the nonstructural protein NS1 generals beneficially by the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genome polyprotein - dengue virus type 1 (strain Western Pacific) (fragment)
N;Contains: capsid protein C; envelope protein E; membrane-associated protein M; nonstru C;Species: dengue virus type 1
C;Species: dengue virus type 1
C;Accession: A27032
R;Mason, P.W.; McAda, P.C.; Mason, T.L.; Fournier, M.J.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PERSONAL 20

PROMOTE POLYProtein - dengue virus type 2 (strain PUO-218) (fragment)

N. Conteains: envelope protein E; membrane-associated protein M; nonstructural protein NSI
C;Species: dengue virus type 2
C;Date: 30-Sep-1993 #sequence_revision 30-Sep-1993 #text_change 31-Dec-2004
C;Accession: PS0043

Threeloope protein sequences of dengue virus isolates TH-36 and TH-

and identification of a type-specific genetic marker for dengue
and itck-borne Ilaviviruses.";

J. Gen., Virol. 73:207-212(1992).

C. IP THM: Specific enzymatic cleavages in vivo yield mature proteins

(By similarity).

C. IP MISCELLANBOUS: The virion of this virus is a nucleocapsid covered
by a lipoprotein envelope. The envelope contains two proteins: the
protein M and glycoprotein E. The nucleocapsid is a complex of
protein M and glycoprotein E. The nucleocapsid is a complex of
protein M and glycoprotein E. The nucleocapsid is a complex of
consists of three heterodimers of envelope protein M precursor

(PrM) and envelope protein E (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms Distributed under the Creative Commons Attribution-NoDerivs License

                                                                           07-MAR-2006, entry version 43.
Genome polyprotein [Contains: Envelope protein M (Matrix protein);
Major envelope protein E; Nonstructural protein 1 (NS1)] (Fragment).
Dengue virus type 2 (strain TH-36).
Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
Flavivirus, 10-ngue virus group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EMBL, D10514; BAA01389.1; -; Genomic_RNA.
